

Greatest Common Divisor

Def: $\text{gcd}(a, b)$ is the largest positive int. that divides both.

Examples:

- 1) $\text{gcd}(15, 12) = 3$
- 2) $\text{gcd}(2^3 \cdot 3^7 \cdot 5 \cdot 11, 2^2 \cdot 3^{13} \cdot 5 \cdot 13) = 2^2 \cdot 3^7 \cdot 5$
- 3) $\text{gcd}(n, 0) = |n|$

Euclid's Alg: (or Euclidean Algorithm)

Exercise: Prove that for $a, b \in \mathbb{N}$ and $a > b$,
$$\text{gcd}(a, b) = \text{gcd}(a-b, b)$$

PS: $\text{gcd}(a, b) = d$ $\text{gcd}(a-b, b) = d'$
 $d \mid a$ and $d \mid b$ by definition.
so $d \mid a-b$ so $d \leq d'$ by defn of d' .
In the other dir. then $d' \mid a-b$, $d' \mid b$,
so $d' \mid (a-b) + b$ (ie $d' \mid a$) so $d' \leq d$
so $d = d'$.

This is a solid alg. since it reduces the size of the number involved (as a consequence this alg. always terminates)

Example: $\gcd(35, 50) = \gcd(50, 15)$

$$50 = 1 \cdot 35 + 15$$

$$35 = 2 \cdot 15 + 5$$

$$15 = 3 \cdot 5 + 0$$

Ex $\gcd(120, 46)$

$$120 = 2 \cdot 46 + 28$$

$$46 = 1 \cdot 28 + 18$$

$$28 = 1 \cdot 18 + 10$$

$$18 = 1 \cdot 10 + 8$$

$$10 = 1 \cdot 8 + 2$$

$$8 = 4 \cdot 2 + 0$$

Diophantine Equations

Are solutions to linear sys. int. coefficients and integer sol.

e.g. $ax + by = 1$ where $a, b \in \mathbb{Z}$.

Solving this eqn gives you $a^{-1} \bmod b$ and $b^{-1} \bmod a$.

The goal, is to use the steps in Euclid's alg to reconstruct x and y .

$$a = 50 \quad b = 35$$

recipe card

$$\begin{bmatrix} (c,d) \\ n \end{bmatrix} = \{ ca + db = n \}$$

Easy Recipe Card:

$$\begin{bmatrix} (1,0) \\ 50 \end{bmatrix}$$

$$\begin{bmatrix} (0,1) \\ 35 \end{bmatrix}$$

$$\begin{bmatrix} (1,0) \\ 50 \end{bmatrix} = 1 \cdot \begin{bmatrix} (0,1) \\ 35 \end{bmatrix} + \begin{bmatrix} (1,-1) \\ 15 \end{bmatrix}$$

$$\begin{bmatrix} (0,1) \\ 35 \end{bmatrix} = 2 \cdot \begin{bmatrix} (1,-1) \\ 15 \end{bmatrix} + \begin{bmatrix} (-2,3) \\ 5 \end{bmatrix}$$

$$\begin{bmatrix} (1,-1) \\ 15 \end{bmatrix} = 3 \cdot \begin{bmatrix} (-2,3) \\ 5 \end{bmatrix} + \begin{bmatrix} (7,-10) \\ 0 \end{bmatrix}$$

$$\begin{aligned} 50 &= 1 \cdot 35 + 15 \\ 35 &= 2 \cdot 15 + 5 \\ 15 &= 3 \cdot 5 + 0 \end{aligned}$$

Solve $50 \cdot x + 35 \cdot y = 15$

Ex $46x + 13y = 1$

$$\begin{bmatrix} (1,0) \\ 46 \end{bmatrix} = 3 \cdot \begin{bmatrix} (0,1) \\ 13 \end{bmatrix} + \begin{bmatrix} (1,-3) \\ 7 \end{bmatrix}$$

$$\begin{bmatrix} (0,1) \\ 13 \end{bmatrix} = \begin{bmatrix} (1,-3) \\ 7 \end{bmatrix} + \begin{bmatrix} (-1,4) \\ 6 \end{bmatrix}$$

$$46 = 3 \cdot 13 + 7$$

$$13 = 1 \cdot 7 + 6$$

$$7 = 1 \cdot 6 + 1$$

$$6 = 6 \cdot 1 + 0$$

$$\begin{bmatrix} (1, -3) \\ 7 \end{bmatrix} = \begin{bmatrix} (-1, 4) \\ 6 \end{bmatrix} + \begin{bmatrix} (2, -7) \\ 1 \end{bmatrix}$$

$$x \equiv 2 \pmod{6}$$

$$\begin{array}{lcl} \text{What is} & x \pmod{2} & \longrightarrow x \equiv 0 \pmod{2} \\ & x \pmod{3} & \longrightarrow x \equiv 2 \pmod{3} \\ & x \pmod{5} & \end{array}$$

$$\text{if } x = 2$$

$$x = 8$$

$$x = 14$$

$$x = 20$$

$$x = 26$$

$$x \equiv 2 \pmod{5}$$

$$x \equiv 3 \pmod{5}$$

$$x \equiv 4 \pmod{5}$$

$$x \equiv 0 \pmod{5}$$

$$x \equiv 1 \pmod{5}$$

Warm-up: Find mult. inv. of 7 mod 10.

Sol: $7x + 10y = 1$ is an equiv. problem.

Next step: Find gcd of 7 and 10.

$$\begin{array}{|c|} \hline (1,0) \\ \hline 10 \\ \hline \end{array} = 1 \times \begin{array}{|c|} \hline (0,1) \\ \hline 7 \\ \hline \end{array} + \begin{array}{|c|} \hline (1,-1) \\ \hline 3 \\ \hline \end{array}$$

$$10 = 1 \cdot 7 + 3$$

$$7 = 2 \cdot 3 + 1$$

$$3 = 3 \cdot 1 + 0$$

$$\begin{array}{|c|} \hline (0,1) \\ \hline 7 \\ \hline \end{array} = 2 \begin{array}{|c|} \hline (1,-1) \\ \hline 3 \\ \hline \end{array} + \begin{array}{|c|} \hline (-2,3) \\ \hline 1 \\ \hline \end{array}$$

$$\begin{array}{|c|} \hline (1,-1) \\ \hline 3 \\ \hline \end{array} = 3 \begin{array}{|c|} \hline (-2,3) \\ \hline 1 \\ \hline \end{array} + \begin{array}{|c|} \hline (7,-10) \\ \hline 0 \\ \hline \end{array}$$

$$-2 \cdot 10 + 3 \cdot 7 = 1$$

so mult. inv of 7 is 3.

$$x = \begin{cases} a \pmod{3} \\ b \pmod{5} \end{cases}$$

Chinese Remainder Theorem (Sun Zi)

Suppose $\gcd(m, n) = 1$ and $a, b \in \mathbb{Z}$
then

$$x \equiv a \pmod{m}$$

$$x \equiv b \pmod{n}$$

has exactly one solution mod mn .

	0	1	2	3	4
0	0	6	12	3	9
1	10	1	7	13	4
2	5	11	2	8	14

0		2	
	1		3

"Real" proof: Let $\gcd(m, n) = 1$

$$\mathbb{Z}/mn\mathbb{Z} \longrightarrow \mathbb{Z}/m\mathbb{Z} \times \mathbb{Z}/n\mathbb{Z}$$

We want a bijective map.

$$|\mathbb{Z}/mn\mathbb{Z}| = mn$$

$$|\mathbb{Z}/m\mathbb{Z} \times \mathbb{Z}/n\mathbb{Z}| = mn$$

Pf: Consider $c \in \mathbb{Z}/mn\mathbb{Z} \rightarrow (c \bmod m, c \bmod n)$

For finite sets, you only have to check injectivity.

Contradiction: Assume not injective

$$x_1 \not\equiv x_2 \pmod{mn}$$

but

$$x_1 \equiv x_2 \pmod{m}$$

$$x_1 \equiv x_2 \pmod{n}$$

$$\text{This } m \mid x_1 - x_2$$

$$n \mid x_1 - x_2$$

This implies since $\gcd(m, n) = 1$,

$mn \mid x_1 - x_2$ which is contrary to
the assumption that

$$x_1 \not\equiv x_2 \pmod{mn}.$$

Now consider a system

$$x \equiv a \pmod{m}$$

$$x \equiv b \pmod{n}$$

We can use Euclid's alg to find $s, t \in \mathbb{Z}$,

$$ns + mt = 1$$

Observe that $ns \equiv 1 \pmod{m}$ and $mt \equiv 1 \pmod{n}$

Take $x = ans + bmt$

and observe that

$$x \equiv ans \equiv a(1) \equiv a \pmod{m}$$

$$x \equiv bmt \equiv b \pmod{n}$$

Example (re-written ☺) :

$$\text{Solve } x \equiv 5 \pmod{11}$$

$$x \equiv 2 \pmod{7}$$

Sol: By Euclid's,

$$11s + 7t = 1$$

$$\text{for } s=2, t=-3$$

$$\text{Let } x = ams + bmt$$

$$= 2 \cdot 11 \cdot s + 5 \cdot 7 \cdot t$$

$$= 2 \cdot 11 \cdot 2 + 5 \cdot 7 \cdot (-3)$$

$$= -61$$

$$\equiv 16 \pmod{77}$$
